INTERACTIVE END-OF-CHAPTER EXERCISES

COMPUTING THE ONE-HOP TRANSMISSION DELAY

Consider the figure below, in which a single router is transmitting packets, each of length *L* bits, over a single link with transmission rate *R* Mbps to another router at the other end of the link.

Suppose that the packet length is *L*= 4000 bits, and that the link transmission rate along the link to router on the right is *R* = 100 Mbps.

Round your answer to two decimals after leading zeros

QUESTION LIST

1. What is the transmission delay?

2. What is the maximum number of packets per second that can be transmitted by this link?

SOLUTION

The transmission delay = L/R = 4000 bits / 100000000 bps = 4.00E-5 seconds

The number of packets that can be transmitted in a second into the link = R / L = 100000000 bps / 4000 bits = 25000 packets

QUESTION 1 OF 2

What is the transmission delay?

Answer

CHECK HINT SKIP
