PRELIMINARY LAB STUDY

a) Explain field resistance and changing armature voltage speed control methods of a shunt DC motor in concise form with necessary graphics. Describe how field resistance affects motor speed and how changing armature voltage influences the motor's performance. Illustrate these concepts with appropriate diagrams and graphics,

b) Apply these methods for the DC shunt motor given in Simulink with a load of 70 Nm.

c) Also, obtain the plot of torque-speed (output) characteristic of this motor.

Note: The Simulink file is attached to the preliminary Lab study.
